1 Classification Table for Summary

Table 1: Summarized Article Sentence Classification

No.	Sentence	Classification	Evidence Required?	Why?
1	The historical approach to maintaining system correctness used by Amazon Web Services (AWS) was to use a systematic and high-performance optimization language called TLA $\pm$...	F (Established Fact)	Yes	While a factual historical event, specific historical corporate tooling practices require a source for verification.
2	The P Language sought a balance between mathematical thinking capabilities while being easier to understand by using state-machine-based algorithms...	C (Claim)	Yes	Asserting that a language is "easier to understand" is a subjective assertion requiring evidence to support the claim.
3	Some of the crucial works validated using P Language included are; Migration of Simple Storage Service(S3) to a more strong read-after-write consistency...	C (Claim)	Yes	This is a claim for using the language which needs evidence to prove whether the same language was actually used or not for system correctness

No.	Sentence	Classification	Evidence Required?	Why?
4	In 2023 AWS built a new tool PObserve which validated the correctness of distributed systems during both testing and production.	F (Established Fact)	Yes	This is a generally verifiable factual statement regarding a specific tool release, but still requires citation to prove it occurred in 2023.
5	Property-based testing - key idea is that team combines property-based testing with developer-provided correctness specifications, coverage-guided fuzzing, failure injection, and minimization	D (Definition)	No	Actual evidence is not required to show that the premise of the definition that is being described, sentence simply establishes terminology and explains what a concept means.
6	Deterministic simulation - distributed system executes on a single-threaded simulator with control over all sources of randomness;	D (Definition)	No	This sentence simply establishes terminology and explains what a concept means.
7	Continuous fuzzing or random test-input generation - covers guided scalable test-input generation, effective for testing systems correctness at integration time.	D (Definition)	No	This sentence simply establishes terminology and explains what a concept means.
8	AWS launched Fault Injection Service allowing customers to validate that the resiliency mechanisms, improving availability and do not introduce correctness problems. While fault injection...	F (Established Fact)	Yes	Evidence is required to know whether the service launched actually allowed customers to validate their work or not for the system correctness
9	Formal methods are a crucial part of Safely improving the performance of cloud systems. Productivity and cost benefits, the low-level code that normally ignored.	I (Interference)	Yes	Describing something as a "crucial part" is a subjective judgment and a strong assertion. It is not a raw fact; it is a conclusion the author has drawn, which means the reader needs evidence to believe it.

No.	Sentence	Classification	Evidence Required?	Why?
10	Using the HOL Light interactive theorem prover, the team was able to prove the correctness of these optimizations.	O (Observation)	Yes	This is a specific report of a team’s methodology and the tools they used. But there still a need for citation pointing to the AWS paper or report so the reader can verify that HOL Light was indeed the tool utilized.
11	This reduces infrastructure costs and aid sustainability while at the same time improving customer-visible performance.	C (Claim)	Yes	Asserting that these methods directly cause a reduction in costs and improve sustainability is a strong cause-and-effect claim. To justify this, the author would need to provide internal AWS metrics, financial data, or performance benchmarks.
12	This class of failures, dubbed metastable failures, is one of the most important contributors to unavailability in cloud systems.	C (Claim)	Yes	Stating that these failures are "one of the most important contributors" asserts a level of impact that requires statistical or empirical backing.
13	The primary barriers for formal methods tools are steep learning curve, required specialized domain expertise and lack of user-friendly interfaces.	I (Inference / Interpretation)	Yes	This is a conclusion derived from observing the industry; it requires evidence to show these are indeed the *primary* barriers.

2 Classification Table for original article

Table 2: Original Article Sentence Classification

Original Sentence	Classification	Evidence Required?	Evidence Provided by author?	Reasoning
P is a state-machine-based language for modeling and analysis of distributed systems.	D (Definition)	No	Yes	It formally defines the core architecture and fundamental purpose of the P language, setting an unambiguous conceptual baseline rather than stating an empirical result.
This systematic approach toward systems correctness has become a force multiplier at AWS’s scale, enabling faster development cycles through improved developer velocity while delivering more cost-effective services to customers.	C (Claim)	Yes	Yes	It asserts a broad organizational value proposition regarding developer productivity and cost efficiency, supported qualitatively through narrative case studies rather than exhaustive empirical metrics.
In 2014, Yuan et al. found that 92% of catastrophic failures in tested distributed systems were triggered by incorrect handling of nonfatal errors.	O (Observation)	Yes	Yes	It presents a specific, quantitative empirical finding derived from experimental software failure testing, strictly requiring an external citation to be credible
Modeling a key commit protocol for the Aurora relational database engine in P and TLA+ allowed us to identify an opportunity to reduce the cost of distributed commits from 2 to 1.5 network roundtrips without sacrificing any safety properties.	I (Interference)	Yes	Yes	It derives an analytical deduction from state-machine model checking, deducing that the underlying consensus protocol could be structurally optimized without violating safety invariants.

Original Sentence	Classification	Evidence Required?	Evidence Provided by author?	Reasoning
For example, Amazon.com ran 733 FIS-based fault-injection experiments in preparation for Prime Day 2024.	O (Observation)	Yes	Yes	It reports a concrete, measured empirical record of fault-injection testing executed inside Amazon. An empirical count like "733 experiments" represents an observed industrial metric that requires factual verification.
We anticipate that increased industry adoption of formal methods and automated reasoning will attract more talent to this domain.	A (Assumption)	Yes	No	Explicitly signaled by "We anticipate", this is a forward-looking speculative prediction about labor market dynamics and industry talent acquisition, which cannot yet be verified empirically.
