

Group	Earlier Topic	Focused Question for Evidence Synthesis
1	Binary Search	Under what data and access conditions does binary search provide a practical performance advantage over alternative search methods?
2	Merge Sort	How do dataset characteristics and computing environment affect the performance of merge-sort-based approaches compared with other sorting approaches?
3	Dijkstra's Algorithm	How do graph size, density, and data structures affect the practical performance of Dijkstra-based shortest-path algorithms?
4	Deadlock	What trade-offs arise among deadlock prevention, avoidance, detection, and recovery approaches in contemporary computing systems?
5	Operating System Process / Scheduling	How do different CPU scheduling approaches affect waiting time, response time, throughput, and fairness under different workload characteristics?
6	Database Normalization	What trade-offs between data integrity and query performance arise when database designs move between normalization and denormalization?
7	TCP Three-Way Handshake / TCP	How do network conditions affect TCP connection establishment and performance, and what approaches have been proposed to reduce the associated latency?
8	Neural Networks	How do model complexity and interpretability trade off against each other in neural-network-based classification?
9	Blockchain	What trade-offs among decentralization, security, throughput, and energy/resource consumption are reported for blockchain systems?
10	RSA / Public-Key Cryptography	How do RSA key size and implementation choices affect the trade-off between security and computational performance?
11	Decision-Tree Classification	Under what dataset and problem characteristics do decision-tree-based classifiers remain competitive with more complex classification methods?
